
Put JUGA snippet {jugaaccess} into the source code

Posted by tullski - 2008/07/04 17:26

Hi,

just tested via content editor

{jugaaccess Trainer} This is just a test{/jugaaccess}

this works.

Is it also possible to use this

{jugaaccess Trainer} This is just a test{/jugaaccess}

directly into the source code?

Didn't work on index.php from the template.

Any possibilities to use this kind of snippet directly into the source code of modules or components?

Thx

M

This may be a silly question, but you have put it in as if you were putting in text? Just inserting it into the source code may not work, in the same way just putting text in wont work, as the code is in php. I can't remember the exact code, but I'm pretty sure you need some tags in order to get it read as 'text'.

This was theoretically speaking.

Is there a way i can get the users group via PHP/SQL or a JUGA Function?

I like to set up some loops which are getting the usergroup and the then show the desired content.

i know this can be done with Juga hidden module.

But i like to to this within the source code.

Any ideas?

thx

M
